

My Bachelor's thesis work discusses cultural activities of visually impaired people. My work has to offer explanation to questions, which sighted person can pose with connection of cultural activities of visually impaired people or to questions, which visually impaired person can pose to himself – can visually impaired person create, can feel an art, does need art for his life? We cannot hear and read much often about haptic exhibitions and visually impaired person is not seen much often at common exhibitions. I consider about this problem in my work. I can claim partial evaluation of situation that refers an offer of cultural activities of visually impaired people. Cultural activities has according to my opinion an inconsiderable effect to handicapped people and are very important for them. From all those findings appears discovery about need of person to create and picture. Visually impaired people has the same needs and their creativity, need not to be affected with visual defect. And need not to be restricted, if we offer an involvement to different kinds of cultural activities and make an accessible art with the help of modern technical instruments and sensitively creation of cultural and educational programs.
